Subject: RM 10.9, Cap design....

Hi Rob,

Thank you for sending the memo from Dr. Reible earlier today. CDM reviewed the document and it addressed their concerns. We do have one additional (unrelated) comment on Section 7 of the design. This is in addition to the comments I just forwarded you from NJDEP.

- Please collect surface grab samples of the post-dredge surface prior to capping to document the concentrations of COPCs remaining just under the cap. We can discuss the density of this sampling, but it should include both the original removal area plus the finger (where dredging will occur to native material).

Thanks,

Stephanie
